

Figure 4-8 Simulated and Observed Water Level in Lake Alligator and in Lake Toho

#### 4.3.4 Groundwater Stages

The groundwater model calibration used 36 wells screened in the surficial aquifer. Most of the wells were established as part of the recent Alligator Lake and the Lake Toho draw-down studies and thus only contained (daily) stage data from 1998 through 2000. The new Lake Toho drawdown study wells have telemetry data from May 2000 and onwards. Some of the wells have troll-logger data from March to May 2000. Hydrographs with simulated and observed groundwater stages are included in Appendix F.
